

Using haproxy (Load balancer)

Note: Take all fresh machines

- Take three machines (1 for haproxy, 2 for webserver)
- On **both webserver** machines, install and configure **httpd** service
- First webserver will show webpage
 - "This is first webpage."
 - verify on windows machine's browser using **first webserver's IP**.
- Second webserver will show webpage
 - "This is second webpage."
 - verify on windows machine's browser using **second webserver's IP**.
- On **HA-Proxy Server** machine install and configure **haproxy** service.
- Check the output by using **curl** of **haproxy server's IP**.
- On windows machine's browser give IP address of **haproxy server** machine, and check the output.

Expected Output: It should show, both webpage after refresh.

After completing this assignment.

Additional: You can make ebook website highly available.

- A developer has created an **ebook website** for a company. Now, they want to host this website on a server and make it accessible to users.
- The developer has shared the website code. Download it using the **wget** command:

<http://192.168.0.51/lab-material/Linux/ebook.tar.gz>
