

MySQL Assignment-1

1. Start the MySQL shell using the root user.
2. Check all existing databases in the system.
3. Create a new database named `ecommerceDB`.
4. Ensure that no error occurs if the database already exists.
5. Select the `ecommerceDB` database for further operations.
6. Create a table named `customers` to store customer details.
7. Define a primary key in the table.
8. Display the structure of the `customers` table.
9. Verify the table creation statement.
10. Remove some unnecessary columns from the table.
11. Add a new column to store customer contact (phone number).
12. Modify the data type of an existing column.
13. Create a table named `addresses`.
14. Link the `addresses` table with the `customers` table using a foreign key.
15. Verify that the foreign key relationship is correctly established.
16. Create a table named `products` to store product details.
17. Define a primary key in the `products` table.
18. Rename an existing column (e.g., `image` → `profileImage`).
19. Remove an unnecessary column from the table.
20. Add a new column to store product keywords.
21. Increase the size of the description column.
22. Create a table named `cart`.
23. Link the `cart` table with the `customers` table using a foreign key.
24. Link the `cart` table with the `products` table using a foreign key.
25. Design the structure to store quantity and price in the cart.
26. Rename an existing table.
27. Delete all data from a table without deleting the table itself.

28. Delete a table completely (both structure and data).
 29. List all tables in the database.
 30. Check the structure of any one table and verify all changes.
-

Tables for E-commerce Database (if required)

1. Customers Table

- id (Primary Key)
 - name
 - email
 - password
 - phone
-

2. Addresses Table

- id (Primary Key)
 - customerId (Foreign Key → customers.id)
 - address
 - city
 - state
-

3. Products Table

- id (Primary Key)
 - title
 - description
 - price
 - brand
 - profileImage
 - keywords
-

4. Cart Table

- id (Primary Key)
- customerId (Foreign Key → customers.id)
- productId (Foreign Key → products.id)
- quantity
- price
